12a. DISTRIBUTION AVAILABILITY STATEMENT APPROVED FOR PUBLIC RELEASE; DISTRIBUTION IS UNLIMITED.				12b. DISTRIBUTION CODE	

ABSTRACT The premise for the conference was that photonics is an emerging technology in physics, chemistry, optics, and materials science for optical information and signal transmission and processing. The materials and phenomena of interest enable a variety of functions including optical frequency and amplitude modulation, parametric processes such as frequency conversion and amplification, switches between signal paths, analogue and digital computing functions, and a variety of signal processing functions. The conference was organized into the following topical areas: 1) second order nonlinear optics - materials, design, synthesis, fabrication, characterization, and processing into device structures, 2) third order nonlinear optics - fundamental mechanisms, materials, processing applications, devices, 3) polymers in fiber optics - cladding, guiding properties, applications, 4) molecular assembly approaches - Langmuir Blodgett and molecular self assembly as a means of controlling thin film architecture, 5) polymers in microsensors. The approach to the conference was informal, in the Gordon Conference sense to encourage open exchanges of information.

Dear Colonel Burggraf:

In accordance with our discussion, this letter serves as the final technical report for grant #AFOSR-89-0452.

A proposal was submitted to Dr. Donald Ulrich early in 1989 requesting US Air Force support for a joint conference on Polymers in Photonics to be held at the 1989 International Chemical Conference of Pacific Basin Societies in Honolulu Hawaii from December 17-22. This meeting was the first joint US-Japan conference to exchange academic and precompetitive research in this rapidly emerging area of science. The meeting was chaired jointly by Dr. Masao Kato from RIKEN, Professor John White from the Australian National University, and myself. The Symposium consisted of 23 invited participants, primarily from the US and Japan. Dr. Donald Ulrich of the AFOSR attended and was an active participant in the conference. A list of speakers and titles is attached.

The premise for the conference was that photonics is an emerging technology in physics, chemistry, optics, and materials science for optical information and signal transmission and processing. The materials and phenomena of interest enable a variety of functions including optical frequency and amplitude modulation, parametric processes such as frequency conversion and amplification, switches between signal paths, analogue and digital computing functions, and a variety of signal processing functions. It has been recognized in recent years that polymers containing molecularly engineered pi electronic systems exhibit extremely large second and third order nonlinear optical properties and with proper materials, optical, and

device engineering might be useful for many of the above mentioned applications. The ability to design and synthesize and process these materials into thin film formats and their compatibility with Si and compound semiconductor substrates might eventually lead to photonic technologies with significant commercial potential. The conference was therefore held to comprehensively explore the potential role of polymers in photonics.

The conference was organized into the following topical areas:

1. second order nonlinear optics - materials, design, synthesis, fabrication, characterization, and processing into device structures.
2. third order nonlinear optics - fundamental mechanisms, materials, processing, applications, devices.
3. polymers in fiber optics - cladding, guiding, properties, applications.
4. molecular assembly approaches - Langmuir Blodgett and molecular self assembly as a means of controlling thin film architecture.
5. polymers in microsensors

The approach to the conference was informal, in the Gordon Conference sense, to encourage open exchanges of information. For this reason formal publication of the proceedings was avoided. The abstracts of the paper were published in the Book of Abstracts - The 1989 International Chemical Congress of Pacific Basin Societies Part 1, Symposium 07G, papers 12-17, 40-45, 80-85, 136-140, 181-185.

The impact of the Symposium on future progress and communication within the international community conducting research in this area was considerable. Since that first joint US- Japan conference, regular exchanges of information have taken place between scientists and engineers in these countries. Very notable is the SPIE conference on Polymers in Nonlinear Optics which has become one of the largest and most popular of the conferences in this field. The lines of communication that were set up during that first conference greatly facilitated future exchanges of information.

From a more technical point of view the conference was also a success. Considerable scientific progress has been made in the development of materials and devices, particularly for second order nonlinear optical applications. The discussions of device related Figures of Merit were particularly useful since they established critical device related materials parameters that must be achieved before real applications could be found. Emphasis on high temperature performance to meet the military requirements has resulted in new initiatives and progress in that area. New materials, based on molecular assembly techniques have now shown impressive waveguide qualities and large figures of merit for second harmonic conversion. Good progress is also being made in the theory and development of new materials for third order nonlinear optics.

Finally, on behalf of the co-chairmen and myself I would like to express my gratitude to the AFOSR for their support of the conference. I believe that the exchanges of information and ideas had considerable benefit and stimulation to the participants, most of whom are leaders in this emerging field of research.

Sincerely yours,

A handwritten signature in cursive script, appearing to read "David J. Williams".
